Notice Regarding System Disruption Caused by Unauthorized Third-Party Access [Final Report]

With regard to the “Notice Regarding System Disruption Caused by Unauthorized Third-Party Access” announced on September 28, 2026 and the “Update Regarding System Disruption Caused by Unauthorized Third-Party Access” announced on September 30, 2026, we have been conducting an investigation with the assistance of an external specialist organization to assess the extent of the damage and identify the cause.

The investigation into this incident has now been completed, and we hereby report the findings below.

Details

1. Discovery and Response

On Wednesday, September 16, 2026, it was discovered that certain English-language websites operated on a rental server provided by an external service provider had been subject to unauthorized external access and that malicious programs had been installed on them. To prevent further damage, we suspended all websites on the same day.

[Affected Websites]

- Websites of Overseas Consolidated Subsidiaries (FUKUVI VIETNAM • FUKUVI THAILAND)
: fvc.fukuvi-jp. com, ftc.fukuvi-jp. com
- Building Materials Products Special Website (English) : fukuvikenzai.com
- Fandaline Website (English): fandaline.fukuvi-jp.com

2. Findings of the Investigation by an External Specialist Organization

The investigation conducted with the assistance of an external specialist organization confirmed that the initial intrusion occurred on Wednesday, September 2, that a malicious program enabling remote control of the server was installed, and that the damage gradually spread to other websites on the same server.

The websites affected by unauthorized access in this incident were certain English-language websites for overseas audiences hosted on a rental server provided by an

external service provider. These websites operated in an environment separate from the servers used to manage and operate our core systems, internal network and domestic websites, including our corporate website. Accordingly, no impact from this incident has been identified on our core systems, internal network or the servers we manage and operate.

Furthermore, none of the malicious programs detected were found to directly infect website visitors' computers with viruses, and no impact on website visitors has been identified to date.

3. Extent of Damage

No personal information of customers or business partners was stored on the affected websites, and no traces or evidence of any external leakage of third parties' personal information were found.

However, regarding administrator account information for the affected websites, evidence was found that the attacker had viewed the profile pages of 3 administrators. The main types of information that may have been leaked are as follows.

[Administrator Account Information That May Have Been Leaked]

- Login names
- Display names
- Company email addresses
- Password hash values

As the potential disclosure of this information may constitute a personal information breach, we have notified the employees concerned and submitted a report to the Personal Information Protection Commission.

4. Measures to Prevent Recurrence and Future Actions

Based on the findings of the investigation and with advice from an external specialist organization, we will strengthen security measures for our systems and networks and enhance our monitoring framework to prevent recurrence.

We also plan to restore public access to the affected websites, which are currently suspended, in stages once the conditions for their safe restoration and reopening have been met.

The timing of reopening has not yet been determined. We will provide an announcement on our corporate website once preparations for reopening are complete.

No events that would have a material impact on our consolidated financial results have been identified in connection with this incident.

We sincerely apologize to our shareholders, investors, customers and business partners for the significant concern and inconvenience this incident has caused.
